

EUROPEAN SAURIA IN THE HERPETOLOGICAL COLLECTION OF THE TRIESTE NATURAL HISTORY MUSEUM

NICOLA BRESSI

Trieste Natural History Museum, P. Hortis 4, I-34123 Trieste, Italy
(e-mail: bressi@comune.trieste.it)

Bressi, N.: European Sauria in the Herpetological Collection of the Trieste Natural History Museum. *Nat. Croat.*, Vol. 8, No. 3., 345–366, 1999, Zagreb.

The Herpetological Collection of the Trieste Natural History Museum has almost 700 specimens of European Sauria belonging to about 33 taxa, including all the lacertids of northern Adriatic regions. The origin of the collection dates back to the foundation of the Museum of Trieste in 1846, but it was increased mainly between 1871 and 1939. The Herpetological Collection of the Trieste Natural History Museum has a great scientific and historical importance; it documents the variation of the composition and distribution of northern Adriatic Sauria fauna during this century, including endemic varieties typical of little islands.

Key words: Sauria, distribution, North Adriatic regions, collection, Trieste Natural History Museum

Bressi, N.: *Europski gušteri u Herpetološkoj zbirci Prirodoslovnog muzeja u Trstu.* *Nat. Croat.*, Vol. 8, No. 3., 345–366, 1999, Zagreb.

Herpetološka zbirka Prirodoslovnog muzeja u Trstu sadrži gotovo 700 primjeraka europskih guštera iz otprilike 33 svojte, uključujući sve lacertide sjevernojadranskih područja. Zbirka podrijetlom seže u doba osnivanja Muzeja Trsta 1846. godine, a uglavnom je povećana između 1871. i 1939. godine. Herpetološka zbirka Prirodoslovnog muzeja u Trstu ima veliko znanstveno i povijesno značenje i svjedoči o promjenama u sastavu faune i rasprostranjenju sjevernojadranskih guštera tijekom ovog stoljeća, uključujući endemične varijetete tipične za male otote.

Ključne riječi: gušteri, rasprostranjenost, sjeverni Jadran, zbirka, Prirodoslovni muzej u Trstu

INTRODUCTION

The Herpetological collection of the Trieste Natural History Museum is noteworthy for its scientific and historical value. The Collection of European Sauria includes almost 700 specimens, preserved in 349 glass jars and referable to 33 taxa. Of these, 16 represent the entire lizard fauna of the North Adriatic regions.

Looking at the collecting dates in the catalogue, the oldest specimen seems to date back to 1871, but many unlabelled specimens were acquired or collected immediately after the foundation of the Museum in 1846. In this century the collection was increased mainly between the World Wars thanks to the activity of the director of the Museum at that time (1928–1945), Josef Müller. Müller collected a lot of animals in expeditions and field trips that he carried out in Carso, the Julian Alps, Dalmatia and Velebit. After 1940 the Museum acquired a small number of animals and the collection was put aside up to the 70s, when Sergio Dolce (today director of the same Museum) took up the activity of collection and determination (DOLCE, 1977; 1979). The collection, enriched subsequently by new specimens and by some important donations, was completely rearranged in 1994 and revised in its formulation and position (BRESSI, 1995).

In the more than a century and half from its constitution, the Herpetological Collection of the Trieste Natural History Museum has been transformed from a typical display collection to a more museological and scientific one. The specimens that are today collected for the Museum are generally recovered dead (often run over) and preserved as tangible evidence of the saurian fauna of the North Adriatic area.

The animals of the collection are gathered in single »faunal units« (LAPINI, 1984; GAVETTI & ANDREONE, 1993; BRESSI, 1995) where the same catalogue number and the same containers are shared only by specimen of the same species, locality and collecting date. According to the recommendations of the Scientific Museums National Association – A.N.M.S. – (CONCI, 1984), every faunal unit is filed with all the available data being inserted in a Data Base. The single samples – tied to a label with catalogue number, species, locality and collecting date – are put back in a hermetically sealed glass jar (see HERHOLDT, 1990). With rare exceptions (mainly skeletons and dry specimens), the animals are preserved in 70% ethyl alcohol.

MATERIALS AND METHODS

The continuous progress in the herpetological research, in particular from the use of biochemical methods, causes a continuous modification of systematics and nomenclature. Subspecies that are of older classification and have been demonstrated genetically to be invalid can nevertheless continue to provide a lot of information about the taxa from an historical, museological and even ecological point of view. For this reason I have tried to update the taxonomy of each taxon, but at the same time I always report also the original subspecies or variety name written on the label. In compiling the present catalogue I have mainly followed MERTENS & WERMUTH (1960), BÖHME (1981, 1984, 1986), LANZA (1993), LANZA & CORTI (1993) and GASC *et al.* (1997). The use of other recent and specific works about some taxa are given in footnotes.

For each specimen (or faunal unit) I have reported all the data it has been possible to find, as follows:

- Catalogue number.

– Origin (arranged whenever possible – from the general to the particular, updated to the present administrative situation and toponymy, in detail: political state, region, province and/or nearest city or town, precise toponym and – whenever found – altitude of the collecting locality; the present toponym can be followed, in brackets preceded by »o.l.=«, by the original toponym reported on the old label attached to the animal).

– The numbers of specimens are accompanied by the following abbreviations:

es.	specimen
ad.	adult
M	adult male
F	adult female
J	young
MJ	young male
FJ	young female
sk.	skeleton
(d.)	dry

– Collecting date.

– Surnames (and, when known, the initials of the first names) of people that collected (leg.), gave (don.), identified (det.) the specimen or revised (rev.) the identification; original identification reported on the label can be included in brackets preceded by »d.o.«).

Different atlases and maps has been used to localise and update the toponymy (Anonymous, 1957; 1982; 1987; 1988–90; 1992; SCOBEL, 1903; BARATTA & VISINTIN, 1924), and in addition I used KAMMERER (1926) and BÖHME (1986), to identify old toponyms of many different islands.

Whenever deemed useful, systematic, museological and geographical footnotes have been included.

RESULTS

Catalogue of the European Sauria in the Herpetological Collection of the Trieste Natural History Museum:

² LANZA (1993): »The previously recorded presence of *Anguis fragilis* in Sicily is not reliable«. The specimens present in the Trieste Natural History Museum (unfortunately without date, but surely from the oldest collection of the nineteenth century) could perhaps represent new data to prove the reliability of some old records.

1967^(!) – (CROATIA?), Istria, 1 F, 1879, det. F.Werner, (ex 389).

230 – ITALY, Campania, Salerno, 1 ad., 4.1886.

389 – ITALY, Friuli-Venezia Giulia, Gorizia, Ronchi dei Legionari, 11 m, 1 M, 10.10.1901, det. F.Werner.

419 – ITALY, Friuli-Venezia Giulia, Gorizia, Turriaco, 14 m, 1 F, 1928, det. N. Bressi, don. Fam.Jeroniti.

⁴ The distribution of the *Lacerta bilineata* / *viridis* complex at the North Adriatic border of its range is not precisely known (AMANN *et al.*, 1997). Moreover the correct identification of preserved adult specimens is very complicated or quite impossible (AMANN *et al.*, 1997). For these reasons the specimens marked with “(!)” are classified as “probably *Lacerta bilineata*” but actually they came from areas where the presence (also?) of *Lacerta viridis* cannot at present be excluded.

300 – SLOVENIA, Kras, Istria, Koper, Slavnik, 1 J, 12.9.1926, leg. Stenta, det. N.Bressi.

323 – SLOVENIA, Kras, Sežana, Lipica, 403 m, 1 F.

254 – 1 ad., rev. S.Dolce 1980 (d.o. »*Lacerta agilis* Wolf. *fiumana*«).

Podarcis melisellensis kornaticus Radovanovic, 1959

290 – CROATIA, Dalmatia, Kornati, Island of Lavsa, 1 J, 8.1926, leg. G.Müller, det. N.Bressi 1997.

Podarcis melisellensis melisellensis (Braun, 1877)

335 – CROATIA, Dalmatia, Islet of Brusnik (Sv.Andrija, Vis), 1 F, 3.3.1912, leg. Cori, det. F.Werner.

1036 – CROATIA, Dalmatia, Islet of Brusnik (c/o Svetac), 1 M, 1881, det. F.Werner.

1053 – CROATIA, Dalmatia, Islet of Brusnik (c/o Svetac), 1 M, 7.1881, rev. N.Bressi 1998.

Podarcis muralis (Laurenti, 1768)¹¹

329 – CROATIA, Dalmatia, 2 M 1 F.

1033 – CROATIA, Istria, Rovinj, 1 M 1 F, 9.1925, det. E.Schreiber.

1149 – CROATIA, Istria, Rovinj, 1 M, 1925, det. A.Taddei.

9 Melanistic.

10 *Podarcis melisellensis* is absent in the moist and flat plain of Cervignano at the west side of the Isonzo river (LAPINI et al., 1996). The locality "Cervignano" could be applied to the limestone plateau of Ronchi - Redipuglia (Province of Gorizia, 20 km east of Cervignano), where *Podarcis melisellensis* reaches the north-eastern limit of its distribution.

11 The subspecific status of *Podarcis muralis* is unclear (BÖHME, 1986; LANZA, 1993; GASC et al., 1997), for this reason, if not previously indicated in the label, I have not identified the specimens at subspecific level.

- 1157 – CROATIA, Istria, Rovinj, 3 M 1 F, 9.1925, det. E.Schreiber.
- 332 – CROATIA, Dalmatia, Velebit, Paklenica, 700 m, 2 M 2 F, 6.1925, leg. G.Müller.

DISCUSSION

The European Sauria in the Herpetological Collection of the Trieste Natural History Museum constitute one of the most important Italian scientific collections of Sauria, representing a rich historical and cultural heritage, accessible to all scientists, amateurs and students. At present (1998) the collection includes almost 700 Sauria, but, thanks to the activity of Museum curators and collaborators, every year new specimens enrich the collection. In any case, it is important to stress the concept that nowadays no animals are deliberately killed to improve the collection, but many specimens are collected dead on the roads or other animals are brought to the Museum by people who obtain them in very different places and situations.

European Sauria of the Herpetological Collection of the Trieste Natural History Museum are referable to 33 taxa and are subdivided in 314 faunal units. Of these, 9 consist of the family Scincidae, 31 of Gekkonidae, 38 of Anguidae and 236 (75 %) of Lacertidae. *Podarcis siculus* is the taxon present with the highest number of faunal units (59, almost 100 specimens), followed by *Podarcis muralis* (50 faunal units), *Podarcis melisellensis* (39 f. u.) and *Lacerta bilineata / viridis* (36 f. u.). The collecting localities in 150 cases (47 %) are situated in Italy (mainly in the regions Friuli-Venezia Giulia = 96, Calabria = 17, Veneto = 11 and Sicily = 10), in 101 cases (32,2 %) in Croatia (63 in Dalmatia, 20 in Istria and 18 in Kvarner) and in 30 cases in Slovenia.

¹⁵ The specimens must have been imported accidentally.

The altitudes of collecting localities vary between 0 and 1900 metres above sea level. The collecting dates comprehend the period 1871 – 1998, where 32 dates (10,2 %) belong to the last century and 125 dates (40 %) are situated between 1920 and 1939, thanks to the activity of Josef Müller who personally collected more than 100 specimens. Finally, many specimens were determined by important, famous herpetologists of the past, like Franz Werner (34 faunal units), Egid Schreiber and A. Taddei.

In conclusion the Herpetological Collection of the Trieste Natural History Museum can make a contribution to demonstrating the composition and the distribution of northern Adriatic Sauria, including endemic varieties typical of little islands. Above all it is noteworthy that this collection, due to its historical importance (more than 350 specimens were collected before 1940), can be used to document any variations in the composition and distribution of northern Adriatic Sauria fauna during this century.

ACKNOWLEDGEMENTS

I would especially like to thank Sergio Dolce, director of the Trieste Nat. Hist. Museum, and all the Museum staff for making this work possible and for concrete help in different working steps. I am also grateful to Claudia Corti (Univ. of Florence) for discussion about the role and use of subspecies determination in museum collections. Wolfgang Böhme (Mus. A. Koenig, Bonn) and Nikola Tvrtković (Croatian Nat. Hist. Mus., Zagreb) made very useful comments on the manuscript.

Received September 20, 1998
